Incident Summary Report – Boogeyman 2

Incident ID: SOC-IR-2026-BOOGEYMAN2
Severity: CRITICAL
Date of Investigation: April 26, 2026
Incident Responder: Badr Naji

1. Executive Summary

Maxine Beck, a Human Resource Specialist at Quick Logistics LLC, received a spear-phishing email containing a malicious Word document (`Resume_WesleyTaylor.doc`). The document contained an obfuscated VBA macro that downloaded a JavaScript payload (`update.js`) from a remote server. The JavaScript executed via `wscript.exe` which in turn downloaded a binary (`updater.exe`) and established C2 communication on port 8080. The attacker then created a scheduled task (`Updater`) for persistence, decoding a PowerShell command from the registry. All malicious activities were captured in the email, VBA macro analysis (olevba), and memory dump (Volatility).

2. Timeline of Key Events

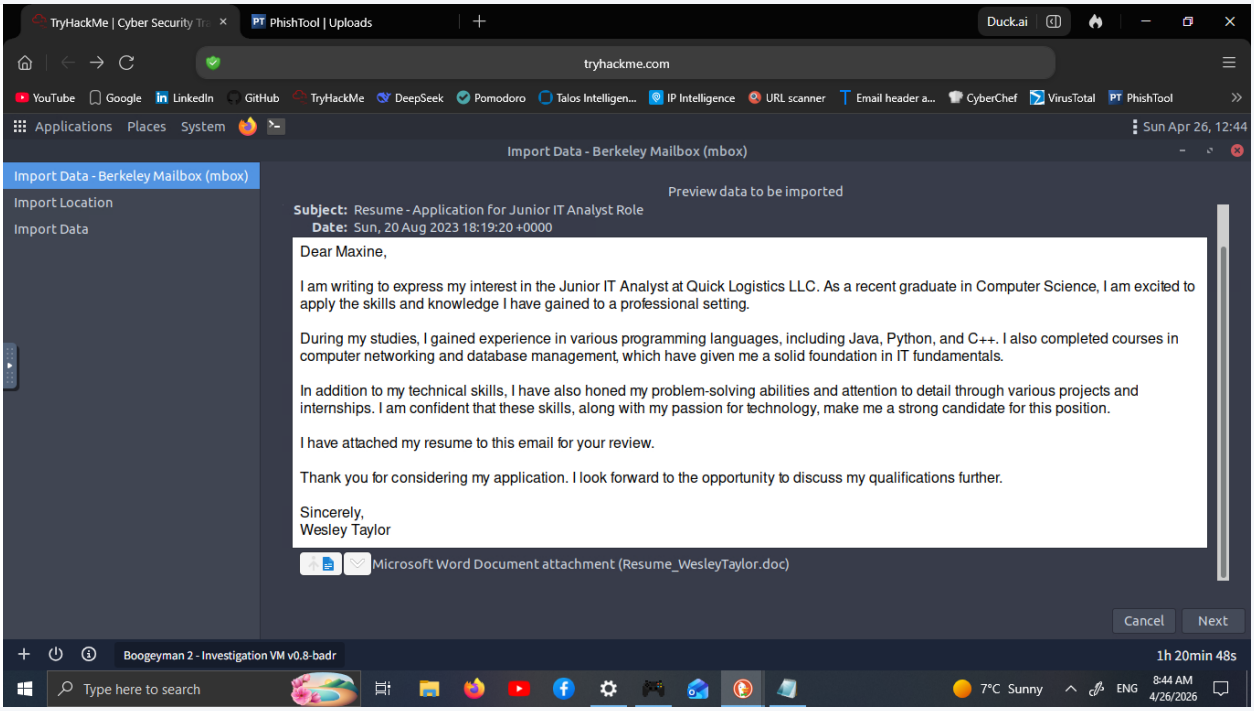
Event Description
Spear-phishing email sent from `westaylor23@outlook.com` to `maxine.beck@quicklogisticsorg.onmicrosoft.com`.
User opened the malicious attachment `Resume_WesleyTaylor.doc` (MD5: `52c4384a0b9e248b95804352ebec6c5b`).

Event Description
VBA macro (AutoOpen) triggered, downloading `update.png` (renamed `update.js`) from `https://files.boogeymanisback.lol/aa2a9c53cbb80416d3b47d85538d9971/update.png`.
`wscript.exe` (PID 4260) executed the downloaded `C:\ProgramData\update.js`.
The JavaScript downloaded `update.exe` from the same domain and saved it as `C:\Windows\Tasks\updater.exe`.
`updater.exe` (PID 6216) launched `conhost.exe` (PID 4464) and established a C2 connection to `128.199.95.189:8080`.
Attacker created a scheduled task `Updater` using `schtasks /Create /F /SC DAILY /ST 09:00 /TN Updater /TR '...'` for persistence.

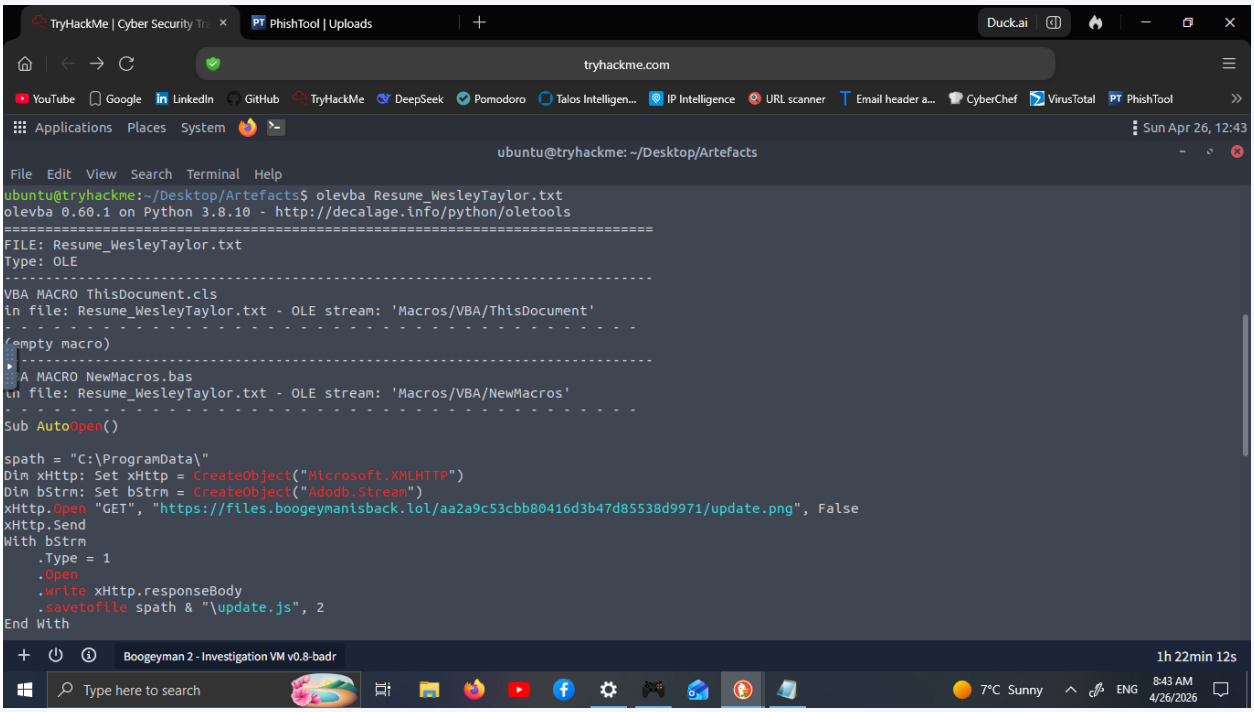
3. Detailed Findings

3.1 Email & Macro Analysis

- **Sender:** `westaylor23@outlook.com`
- **Victim:** `maxine.beck@quicklogisticsorg.onmicrosoft.com`
- **Attachment:** `Resume_WesleyTaylor.doc` (MD5 `52c4384a0b9e248b95804352ebec6c5b`)

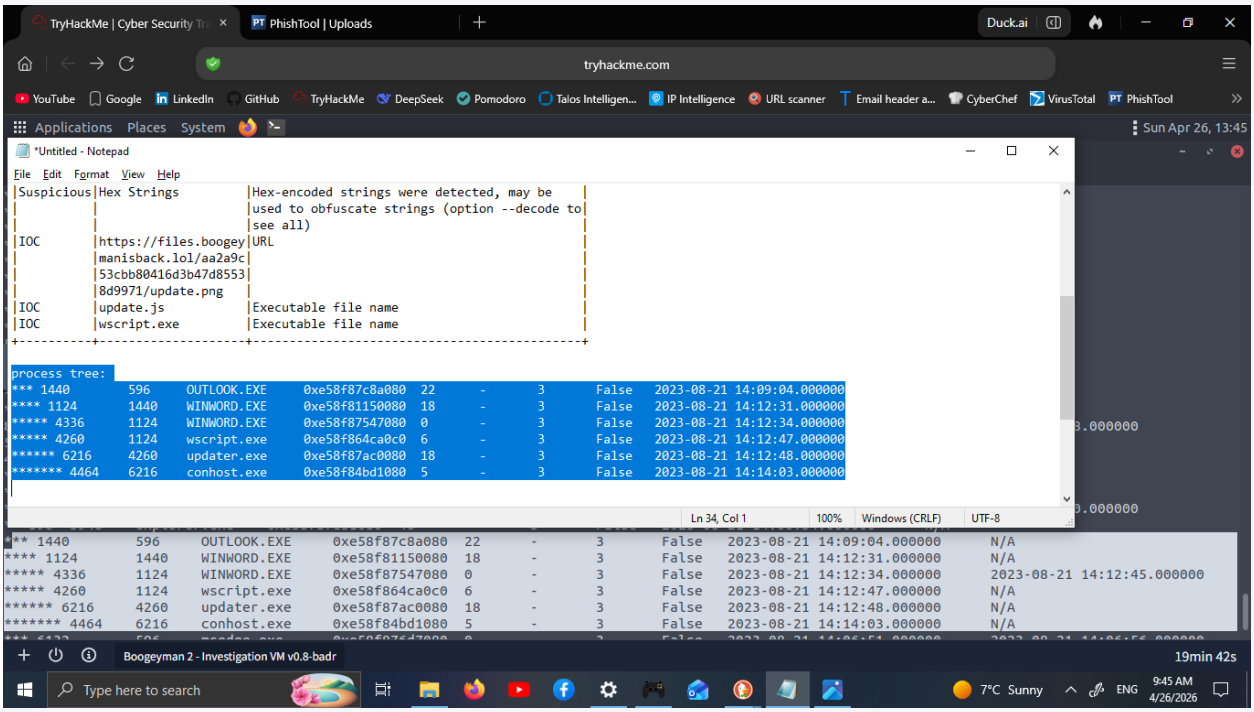


- **Macro indicators (olevba):** `AutoOpen` (executes on document open), `Microsoft.XMLHTTP` (downloads file), `Adodb.Stream` (writes to disk), `wscript.exe` execution.
- **IOCs extracted:** `https://files.boogeymanisback.lol/aa2a9c53cbb80416d3b47d85538d9971/update.png` (renamed to `update.js`).



3.2 Process Execution (Memory Forensics – Volatility)

- **Process tree (parent → child):** `OUTLOOK.EXE (PID 1440)` → `WINWORD.EXE (PID 1124)` → `wscript.exe (PID 4260)` → `updater.exe (PID 6216)` → `conhost.exe (PID 4464)`.



- **Malicious payload path:** `C:\ProgramData\update.js` (executed by `wscript.exe` PID 4260).
- **Final binary path:** `C:\Windows\Tasks\updater.exe` (PID 6216).
- **Email attachment location in memory:** `C:\Users\maxine.beck\AppData\Local\Microsoft\Windows\INetCache\Content.Outlook\WQHGZCFI\Resume_WesleyTaylor (002).doc`.

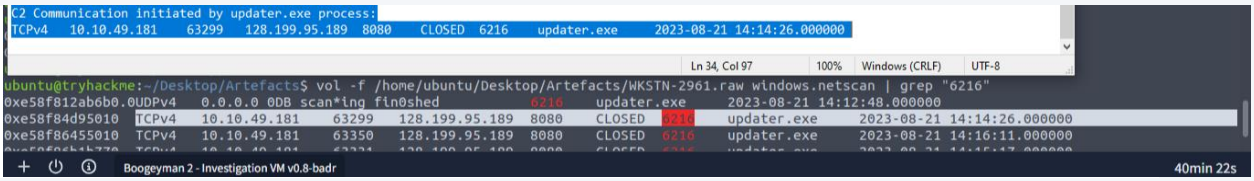
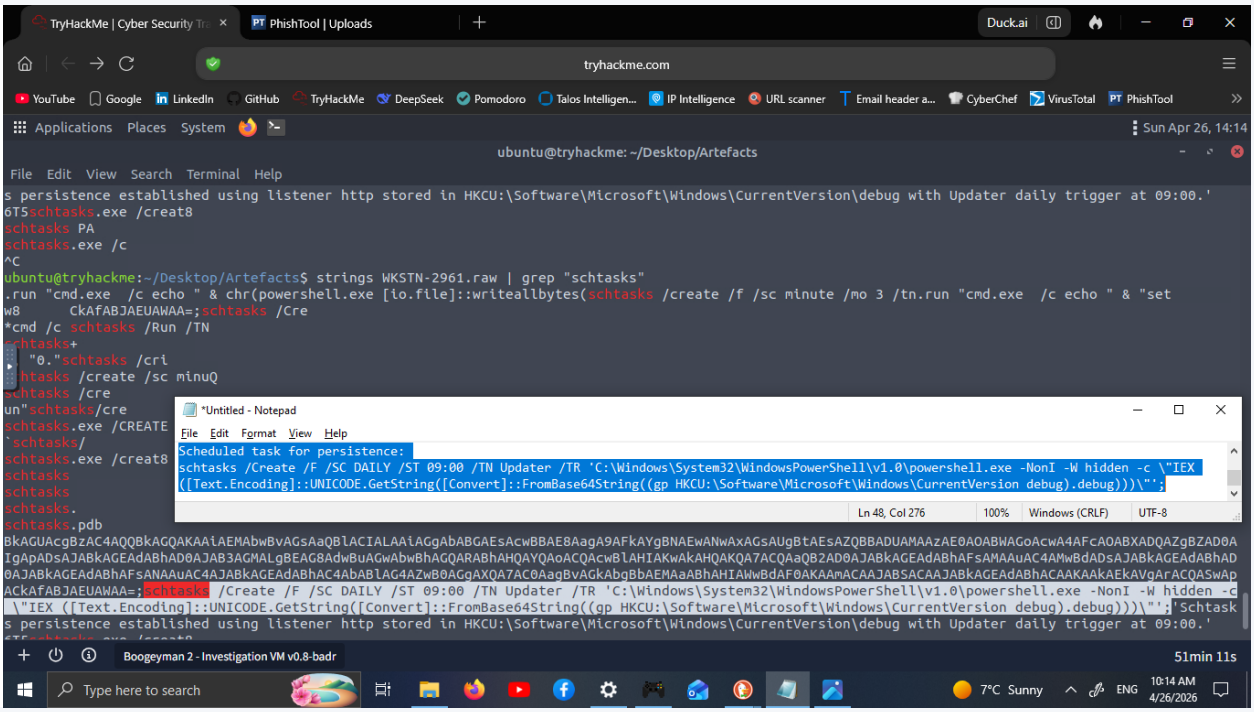
3.3 Network & C2 Activity

- **C2 IP and port:** `128.199.95.189:8080` (initiated by `updater.exe` PID 6216).
- **Protocol:** TCP



3.4 Persistence Mechanism

- **Scheduled task created:** `schtasks /Create /F /SC DAILY /ST 09:00 /TN Updater /TR 'C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe -NonI -W hidden -c \"IEX ([Text.Encoding]::UNICODE.GetString([Convert]::FromBase64String((gp HKCU:\Software\Microsoft\Windows\CurrentVersion debug).debug)))\"'`
- The PowerShell command reads a registry value (`HKCU:\Software\Microsoft\Windows\CurrentVersion\debug`) and executes it after Base64 decoding – a classic fileless persistence technique.



4. Indicators of Compromise (IOCs)

Type	Value
Email sender	`westaylor23@outlook.com`
Malicious document name	`Resume_WesleyTaylor.doc`
MD5 of document	`52c4384a0b9e248b95804352ebec6c5b`
Stage 2 download URL	`https://files.boogeymanisback.lol/aa2a9c53cbb80416d3b47d85538d9971/up`
JavaScript payload	`C:\ProgramData\update.js`
Malicious binary path	`C:\Windows\Tasks\updater.exe`

Type	Value
C2 IP:port	`128.199.95.189:8080`
Scheduled task name	`Updater`
Registry persistence key	`HKCU:\Software\Microsoft\Windows\CurrentVersion\debug`

5. Recommendations

1. **Containment:** Isolate Maxine's workstation immediately. Disable the scheduled task `Updater` and delete `updater.exe` from `C:\Windows\Tasks\`.
2. **Network blocking:** Block the domain `files.boogeymanisback.lol` and the IP `128.199.95.189` at the perimeter firewall.
3. **Registry cleanup:** Remove the malicious registry value `debug` under `HKCU:\Software\Microsoft\Windows\CurrentVersion`.
4. **Audit macro settings:** Configure Microsoft Office to block macros from untrusted sources (GPO).
5. **User education:** Reinforce phishing awareness – do not open unexpected attachments, especially from external candidates.
6. **Improve visibility:** Enable PowerShell Script Block Logging (Event ID 4104) and Sysmon process creation monitoring.

6. Conclusion

The Boogeyman 2 incident demonstrates a multi-stage spear-phishing attack: a malicious Word document with a VBA macro downloaded a JavaScript payload, which in turn fetched a binary that established C2 communication and created a persistent scheduled task (fileless persistence via registry). Memory forensics (Volatility) was essential to reconstruct the process tree, identify files, and capture the scheduled task command. Immediate containment and registry cleanup are required to prevent further compromise.
